## 1. Introduction

This document describes how to download the source code of "*DEMO Client*" through SVN (Eclipse Ganymedes plugin.) and how to create a development environment on your local machine.

The "Demo Client" is an open source project oriented to developers.

## 2. Pre-Requisites

#### 2.1. Eclipse

Eclipse Ganymedes with SVN, MAVEN, ANT and BPEL. You can see the features at "Help/About Eclipse platforms".

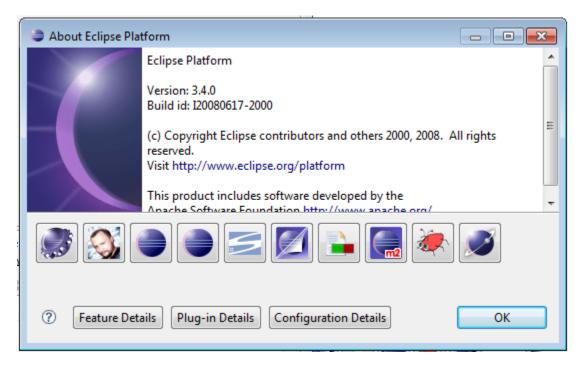

Figure 1: Some of the extra plug-ins that Eclipse Framework needs

#### 2.2. Java version

It is necessary to install the latest JDK version for 32-bits. It is recommended to use version 20 (1.6.0\_20 was used for development).

#### 3. How to prepare your own workspace

To prepare your own workspace on Eclipse to work with the Demonstrator Client you have to install some plug-ins and download four different projects. This guide will provide you the link to download the plug-ins.

#### 3.1. Pre-Requisites

- 1. Eclipse Ganymedes, you can download from <a href="http://eclipse.org/">http://eclipse.org/</a>
- 2. Subversion (SVN) a plug-in to Eclipse, you can find a specification to download and install from: http://subeclipse.tigris.org/servlets/ProjectsProcess?pageID=p4wYuA
- 3. BPEL Designer a plug-in to Eclipse, install according to this guide: http://download.eclipse.org/technology/bpel/update-site/
- 4. To check the correct installation of BPEL and SVN, your wizard for creating new projects should look like the picture bellow:

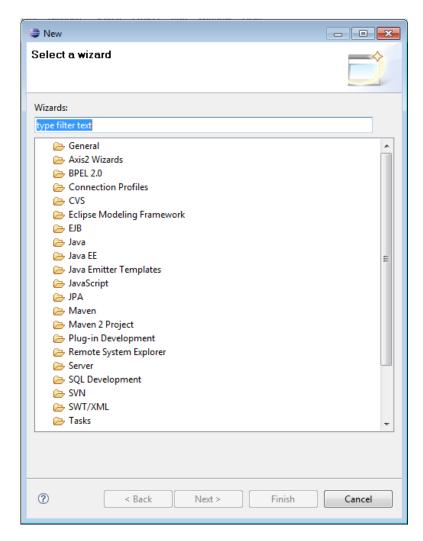

Figure 2: Kind of projects that Eclipse should allow (SVN, BPEL)

#### 3.2. Overview

The Demonstrator Client project is split in four different Java Projects. The first one is the Demo client project (*demo\_client*) which is the application itself (in charge of the visual parts), the second one is the Demo Workflow Engine (*demo\_workflow\_engine*) which contributes to the flow of the project and the other one is the Java Plug-in project (*java\_plugin*) which supports the sending and receiving. This project deals directly with the transport libraries. To start developing with the demo client, first you have to import the project previously downloaded into to your workspace then you need to compile the Java Plug-in project and export it as a jar (plugin.jar). Then the plug-in jar needs to be placed into a folder within the Demo Client project (*demo\_client/plugins/plugin.jar*). And finally the validation engine project (*validation\_engine*) to validate documents in layers.

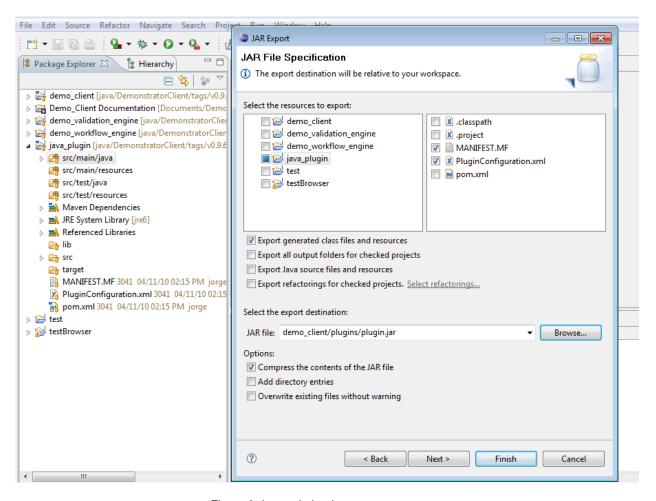

Figure 3: Internal plug-ins

The demonstrator client contains classes that enable it to support and handle all types of xml documents this is expressed in an xml configuration file.

DemoClienConfiguration.xml: This is a file where the configuration of the client is stored (e.g. associations between document types and document namespace + document element name.

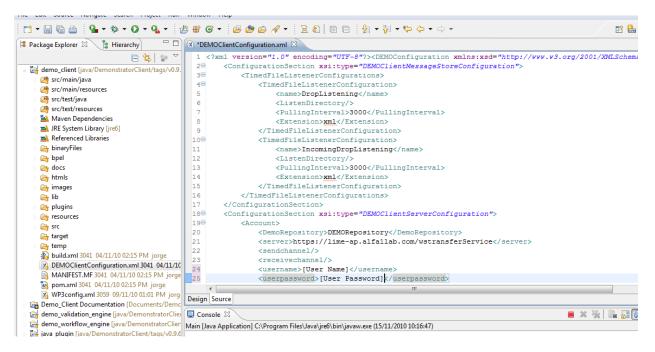

Figure 4: DEMOClientConfiguration.xml file

#### 3.3. MANIFEST.MF

Contains a list of jars that the application requires to work once it's converted into a binary. This file is used to build and execute the Demo Client.

```
*MANIFEST.MF X

1Manifest-Version: 1.0

2Class-Path: lib/busdox-transport-lime-library-1.0.1.jar lib/busdox-transport-commons-1.0.1.jar

3 lib/commons-logging-1.1.1.jar lib/commons-lang-2.3.jar lib/commons-codec-1.3.jar

4 lib/commons-configuration-1.5.jar lib/commons-collections-3.2.jar

5 lib/webservices-tools-1.0.jar lib/webservices-rt-1.0.jar lib/webservices-extra-1.0.jar

6 lib/webservices-extra-api-1.0.jar lib/webservices-api-1.0.jar

7 lib/serializer-2.7.1.jar lib/xalan-2.7.1.jar lib/xercesimpl-2.8.1.jar lib/saxon-9he.jar

8 lib/probatron-0.7.4.jar lib/swt-windows-x86-3.6.jar lib/validation_engine.jar lib/workflow_enginengine.
```

Figure 5: Manifest.MF with basic plug-ins that the Client needs for a binary version

#### 3.4. POM.XML

Contains the structure of libraries the maven project will download using nexus.

```
- -
M demo_client/pom.xml ≅
                                                                                         ^
     <!-- Repositories to search JAR files -->
     <repositories>
         <repository>
             <id>nexus2</id>
             <name>Maven2 Release Repository</name>
             <url>http://pedri.alfallab.com:8081/nexus/content/groups/public</url>
         </repository>
      </repositories>
      <dependencies>
         <dependency>
             <groupId>junit</groupId>
             <artifactId>junit</artifactId>
             <version>4.5</version>
             <scope>test</scope>
         </dependency>
         <dependency>
             <groupId>democlient</groupId>
             <artifactId>busdox-transport-lime-library</artifactId>
             <version>1.0.1
         </dependency>
         <dependency>
             <groupId>democlient</groupId>
             <artifactId>busdox-transport-commons</artifactId>
             <version>1.0.1
         </dependency>
         <dependency>
             <groupId>democlient</groupId>
             <artifactId>commons-logging</artifactId>
             <version>1.1.1
         </dependency>
         <dependency>
```

Figure 6: File that downloads basic plug-ins trough maven

#### 3.5. WP3Config.xml

This file allows the Demo Client to choose between two possible roles (Contract authority or Economic Operator). The Client now allows changing it trough the User Interface.

Figure 7: WP3config.xml

## 3.6. BII07 ProcurementWithInvoiceDispute.bpel

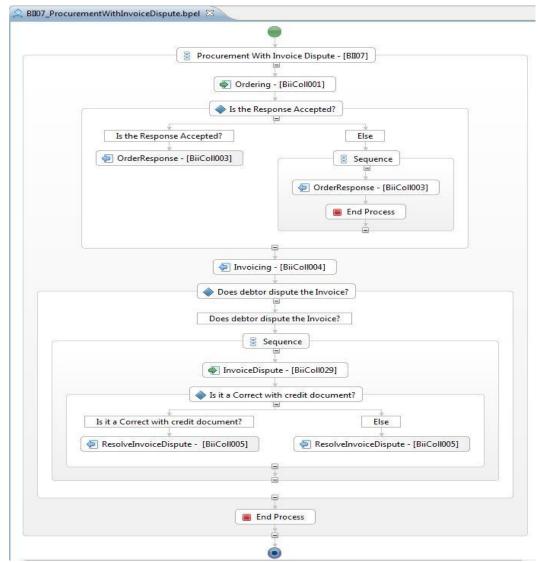

Figure 8: BII07

## 3.7. BII19 AdvancedProcurement.bpel

## 3.8. BII01\_CatalogueOnly.bpel

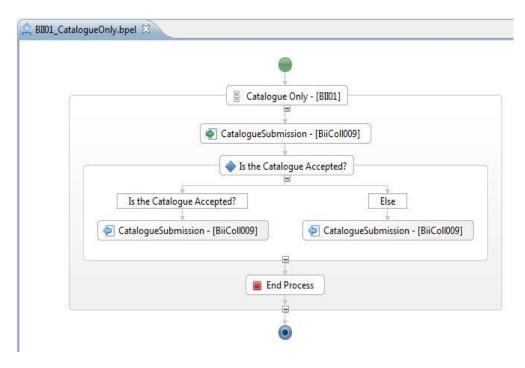

Figure 10: BII01

## 3.9. BII17\_MultiPartyCatalogue.bpel

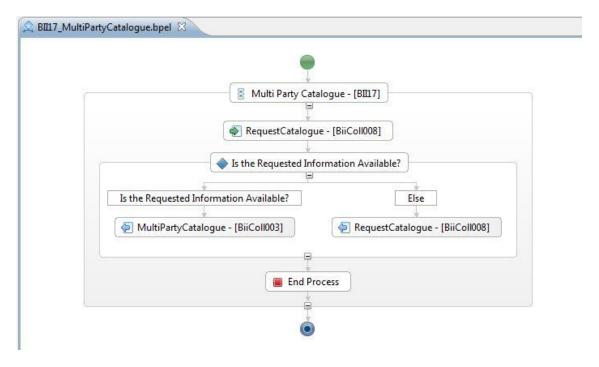

Figure 11: BII17

#### 3.10. Folder structure

The client requires a folder structure to be in place for handling documents that are being created, sent or received. This structure is automatically created by the application the first time it is run. If it is deleted by accident the application will create it again. It is possible to create more than one "DemoRepository" folders in one computer but it is not possible to change a folder's location once it is created.

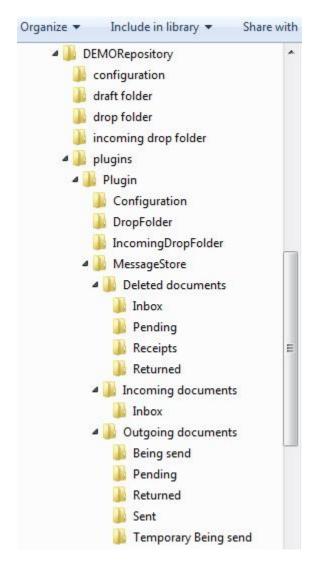

Figure 12: Folder structure

## 4. Source code layout

Path	Document	Description
java/DemonstratorClient/tags/v9.6.10/		PEPPOL source root

build.xml		File to build a binary from Eclipse.
DEMOClientConfiguration.xml		Save data to configure the name of the repository, endpoints, etc/
MANIFEST.MF		This file contains the sign of the author, reference to libraries and the name of the main class to allow the application run.
pom.xml		This file is created to download the libraries from a repository.
WP3config.xml		To configure what kind of authority contractor you are.

### 5. Lesson: Compiling the demonstrator client

To compile the demonstrator client, first you have to download the source code from SVN Repository, using eclipse.

- Demo Client
   https://svn.forge.osor.eu/svn/peppol/java/DemonstratorClient/tags/v0.9.6.0/demo\_client/
- Workflow Engine
   https://svn.forge.osor.eu/svn/peppol/java/DemonstratorClient/tags/v0.9.6.0/demo\_validation\_engine/
- Java Plug-in
   https://svn.forge.osor.eu/svn/peppol/java/DemonstratorClient/tags/v0.9.6.0/java\_plugin/
- Validation Engine
   https://svn.forge.osor.eu/svn/peppol/java/DemonstratorClient/tags/v1.0.0.14/demo\_valid\_ation\_engine

## 6. Lesson: Setting up for local testing

To test the Client's connection against an Access Point service, open the configuration and go to Test Configuration tab and press *Test Client Configuration* 

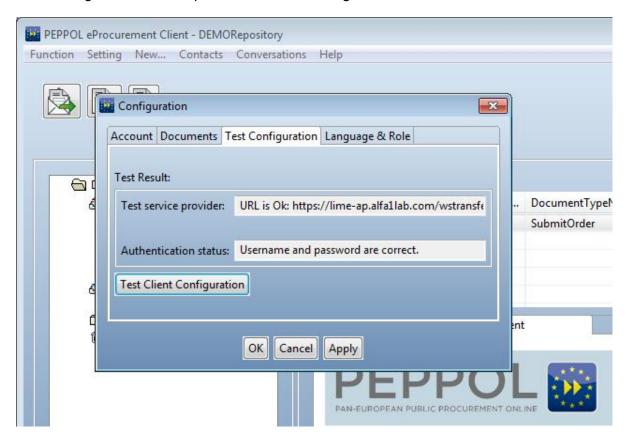

Figure 13: Testing account configuration

#### 7. Lesson: About BPEL

BPEL (Business Process Execution Language) is now working with the business process of Demonstrator Client. BPEL allows creating the flow of a process with dynamic tools within the Eclipse wizard. After building a diagram flow, BPEL will create different files in your workspace. One of the files has the .bpel extension similar to an .xml file; you can parse the file using any library for parsing XML.

#### 7.1. Creating a new BPEL

Start creating a new BPEL Project as the picture bellow:

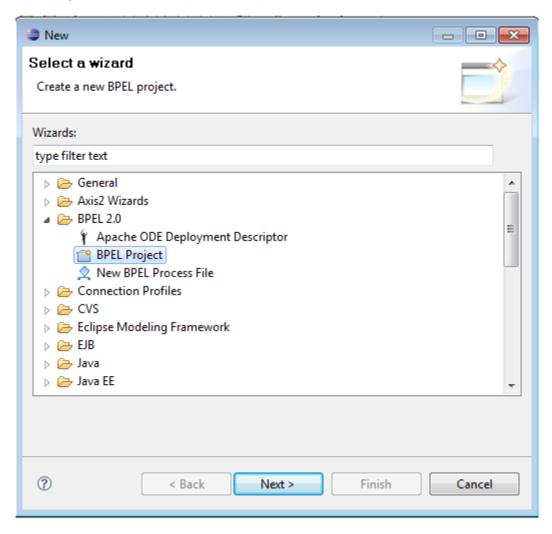

Figure 14: Choosing BPEL Project

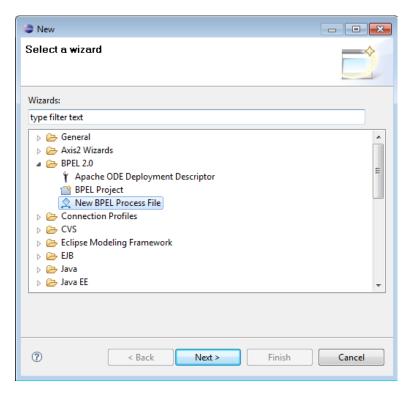

Figure 15: New BPEL Process File

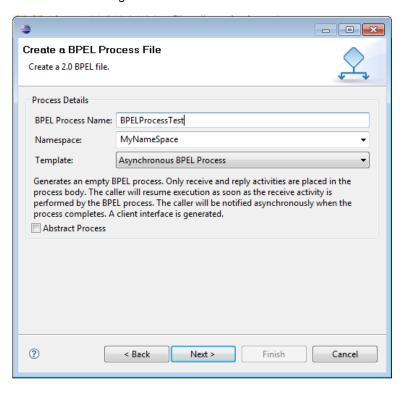

Figure 16: Fill BPEL project information

Then you have to select your BPEL Process file and finally create your own BPEL Model.

#### 7.2. Folder structure

```
binaryFiles
bpel

BII01_CatalogueOnly.bpel 2919 01/09/10 12:
BII03_BasicOrderOnly.bpel 2919 01/09/10 12:
BII04_BasicInvoiceOnly.bpel 2931 05/09/10 0
BII06_Procurement.bpel 2919 01/09/10 12:33
BII07_ProcurementWithInvoiceDispute.bpel 3
BII17_MultiPartyCatalogue.bpel 2919 01/09/:
BII19_AdvancedProcurement.bpel 2919 01/0
PreAward.bpel 2919 01/09/10 12:33 PM jorg
```

Figure 17: Current Profiles that Demonstrator Client supports

#### 8. Lesson: Lime library

The documents will be sent from one client to another using the transport libraries. You can see the libraries referenced in the pom.xml file located into the Java Plug-in project.

```
📓 java_plugin/pom.xml 🔀
  xsi:schemaLocation="http://maven.apache.org/POM/4.0.0 http://maven.apache.org/mav
     <modelVersion>4.0.0</modelVersion>
     <groupId>eu.peppol.demo</groupId>
     <artifactId>plugin</artifactId>
     <name>DEMO Plugin</name>
     <version>0.0.1-SNAPSHOT</version>
     <description>Demonstration Client. See https://www.osor.eu/</description>
     <!-- Repositories to search JAR files -->
     <repositories>
        <repository>
        <id>nexus2</id>
        <name>Maven2 Release Repository</name>
        <url>http://pedri.alfallab.com:8081/nexus/content/groups/public</url>
        </repository>
     </repositories>
     <dependencies>
        <dependency>
            <groupId>democlient</groupId>
            <artifactId>busdox-transport-lime-library</artifactId>
            <version>1.0.1
            </dependency>
     </dependencies>
     files>
        ofile>
            <id>unix-${os.arch}</id>
```

Figure 18: Importing the lime library from maven

Demonstrator Client uses Nexus (see this link for references: <a href="http://nexus.sonatype.org/">http://nexus.sonatype.org/</a> as a repository to download libraries.

The libraries the demo client uses for the document interchange through the transport libraries are busdox-transport-lime-library-1.0.1.jar and busdox-transport-common-1.0.1.jar.

#### 8.1. Folder structure

/demo_client/src/eu/demo/client/transport/LightW eightProfileHandler.java	The main class that use the lime library
Maven Dependencies/busdox-transport-lime-library-1.0.1.jar	Path of the library
Maven Dependencies/busdox-transport-commons-1.0.1.jar	Path of the library
/java_plugin/pom.xml	For the libraries referenced
/demo_client/DEMOClientConfiguration.xml	To see the exact parameters information for sending and receiving documents review the last lines in this xml.

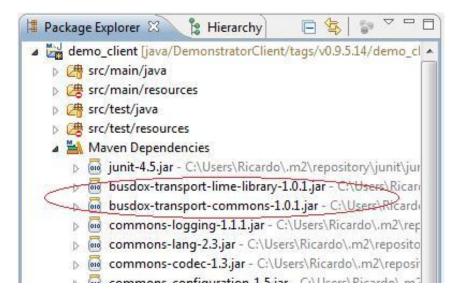

Figure 19: Imported Lime library

#### 8.2. Set up parameters and functionality

There is a Java class into the demo client project called *LightWeightProfileHandler.java* that will be used to handle the lime library, set up parameters and use some inner methods to create the connection.

First you have to see the main parameters for the main communication.

DEMOClientConfiguration.xml

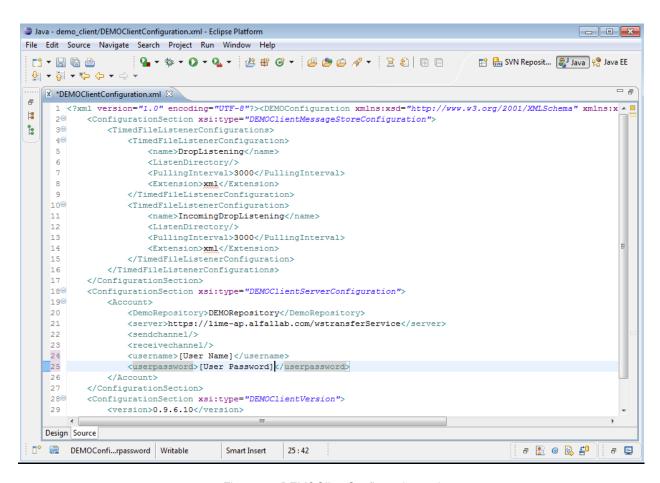

Figure 20: DEMOClientConfiguration.xml

## 9. How to create a "Demo Client" binary

To create your own binary from Eclipse it will be used ANT plug-in. First open the ANT view, drag the "build.xml" to the ant window and double click on it.

Every file will be created in your home folder.

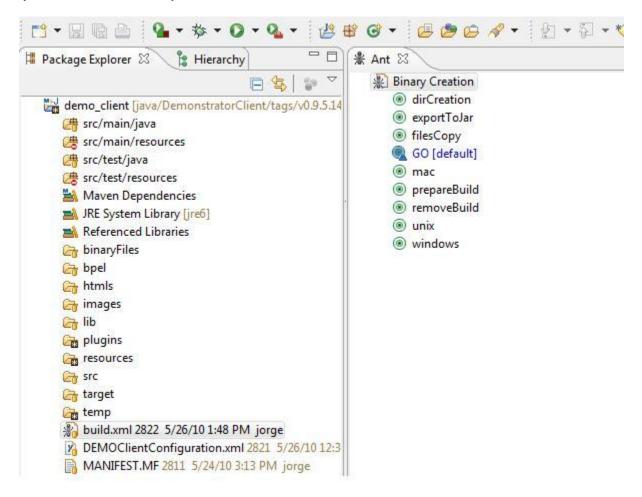

Figure 21: Creating a binary trough Ant

#### 10. Validation Engine

This project is part of "Demonstrator client" development. The validation engine was built as a plug-in project that allows the client to perform validation by layers.

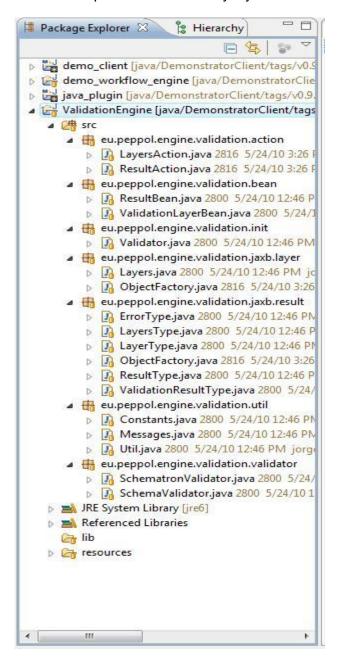

Figure 22: Source of the Validation Engine Project

When you run up the client you will see the function of the validation engine pressing the button "Validate" in the document creation interface.

Figure 23: Example of a Validation Result
